

MEASURING SHEET

Introductory Notes

The diagram to the right represents a typical fireplace. Please alter the drawing to resemble your fireplace, or even draw your own. Photographs are also very helpful.

By having detailed and accurate measurements of your fireplace and hearth, we can determine the correct dimensions of your club fender and the best way to position it in your room.

If there is any fitting (gas pipe, electric socket) which might affect the base butting up to the wall or baseboard, or bookcases close to the fireplace, please draw them in on the diagram, showing both position and distance protruding.

Measuring

Generally, the seats of a club fender will either fit around the outside of the fireplace so that they go back to the wall on either side (see Figure 1), or they will butt up to the mantelpiece supports (see Figure 2). Please check the appropriate box in the illustration to the left for either Figure 1 or 2.

If required we can cut the seat ends to ensure a snug fit as illustrated in figure 3.

Infill plates are usually made of black steel and cover any gaps between the fender base and the hearthstone as shown in figure 4.

We can advise you if you will need infill plates or cut-outs in the seats, and make suggestions that we feel might improve the design of your club fender.

Please complete the measurements on the diagram to the right, and fill in as many of the spaces "A" through "L" as are applicable to your fireplace. Keep in mind that standard seats are 7 inches wide and that the outside edge of the seat is vertically in line with the outside edge of the base for maximum stability.

Finally...

Fill out the Order Form and return both forms to us. We will double-check your measurements and contact you if we find any discrepancies. Please do not worry that there may be a mistake. We know exactly where the critical points are and will not proceed with manufacture until we are absolutely clear.

INFILL PLATE COVERS THIS AREA

Measurements are in inches

- | | | |
|---|---|-------|
| A | Overall height of fender (usually 18" -24") with 20" being typical | _____ |
| B | Overall width of fireplace at seat height | _____ |
| C | Overall width of fireplace at floor level (if different than B) | _____ |
| D | Height of the fireplace (this may affect height of fender) | _____ |
| E | Width of fireplace opening | _____ |
| F | Width of fire basket or grate | _____ |
| G | Thickness of baseboard (if applicable) | _____ |
| H | Distance from baseboard (if any) to the front of mantel supports at floor level | _____ |
| J | Distance from wall to the front of mantel supports at seat height | _____ |
| K | Width of hearthstone | _____ |
| | <input type="checkbox"/> None <input type="checkbox"/> Flat <input type="checkbox"/> Raised | |
| | Do you want the fender base to sit: | |
| | <input type="checkbox"/> on the hearthstone? | |
| | <input type="checkbox"/> around the hearthstone? | |
| L | Depth of hearthstone: L1 (Left-hand side) | _____ |
| | L2 (Right-hand side) | _____ |
